Mr Sidi Mohammed Sari

Director, MarShore Services Algérie

Oran

Oran, October 2026

Subject: Joining MarShore - energy engineering and digital twins

Dear Mr Sari,

Thank you for the conversation at the MarShore stand during NAPEC 2026. What you are building in Oran, emissions accounting with Carbo Brain alongside asset integrity, condition monitoring and digital twins, is the kind of work I want to do, and I would like to contribute to it.

Energy engineering. At Sungy, I wrote energy sobriety plans for industrial clients before sizing their solar systems, and I have since delivered over 1 MWp of PV, including the design of a 5.4 MW zero-injection rooftop plant with battery storage for IFRI in Akbou. Cutting consumption first and then decarbonising the supply is how a Scope 2 reduction is built, and I know the electrical side of it from the load study to commissioning.

Asset data in the field. For Sonatrach's GK3 pipeline SCADA project, I audited 66 remote stations and gave each piece of equipment a condition status. I have also designed ATEX Ex "d" and Ex "p" equipment and commissioned 27 chemical injection skids, so I am at ease on the industrial sites where your inspections and measurements happen.

3D simulation and digital twins. I build real-time 3D simulations in Blender and Godot 4. For an Australian training organisation, I developed an interactive substation switching exercise and a low-voltage rescue and CPR simulation that run in a web browser. The same skills can turn a plant, a vessel or a compressor station into an interactive digital twin: a 3D model linked to measured data, emissions sources and inspection findings, which a client can explore on screen.

To show what I mean, I would be glad to prepare a short demo: a 3D twin of one typical asset, with its emission points and condition tags. As we are both in Oran, I can come by at your convenience to discuss it and how I could support your team.

Yours sincerely,

Nadir Zouaoui
